Instructions for creating a GitHub account

1. Go to https://github.com
2. Select the "Sign up" option
3. Enter the requested information. For the email, use your UA email address.
4. Click "Create account". GitHub will generate a code that is sent to the email address provided, which then has to be entered on GitHub.

From this point on, you can log in to GitHub.

Creating a project

- On first login, a green button appears with the option to create a repository. One member of the group (only one) should create the repository for the group.
- Once the repository has been created, the project's home page has an option to add collaborators: "Invite collaborators". Follow this option and add the remaining members of the group. Each member added receives a message and has to confirm their association with the repository.

At the end of this process, the group is created and the users are associated with it.

Working with the repository

To work with the repository in read/write mode, you need to generate a secure key and register it with GitHub.

Creating a secure key

In a Bash terminal, run the `ssh-keygen` program, which will generate the key:

```
$ cd
$ ssh-keygen
```

Use the default options for all the questions (i.e., just press enter every time).

At the end, the program will print some messages and something like:

```
Your identification has been saved in /home/pf_ua_pt/.ssh/id_ed25519
Your public key has been saved in /home/pf_ua_pt/.ssh/id_ed25519.pub
The key fingerprint is:
SHA256:YWx8j8lCSFYeDVvberGf7goV9pA64WoK35LzqtRHt8g pf_ua_pt@cs-691327707237-default
The key's randomart image is:
+--[ED25519 256]--+
|      o.+o.      |
|     o = +.o .   |
|      . X + B    |
|       + = O *   |
|        S X = .  |
|     . o = = . . |
|    o ..E o   o  |
|   . o+=   . .   |
|    ..+=o   .oo  |
+----[SHA256]-----+
```

In the `.ssh` folder under your home folder, two files with the same base name appear, one of which has the `.pub` extension:

```
$ cd
$ cd .ssh
$ ls -l
total 16
```
